KC Royals.....Kauffman Stadium
St. Louis Cardinals...Busch Stadium
Colorado Rapids....Dick's Sporting
Goods Park
Chicago Cubs.....Wrigley Field
UND Fighting Irish....Notre Dame
Stadium

Characteristics

Bella Bluegrass is a dark, alpine green bluegrass variety that is vegetatively propagated. Bella Bluegrass spreads from rhizomes instead of seeds. Bella is a quick grower laterally, but has very minimal vertical growth. This will equate to 50-80% less mowing for the end user yet allows the grass to repair from damage quickly.

Bella is a superior performer among cool season turfgrasses. Bella thrives in cold climates, yet also is excellent in warm climates. Bella will grow in sand, sandy loam, clay or peat. You can expect Bella to retain fall color longer than many other turf selections and to green up more quickly in the spring. Bella is a durable and versatile turf variety; but as with the selection of any turfgrass, you should understand your own unique local growing conditions prior to purchasing and installing Bella or any other variety.

The turf industry's first and only dwarf vegetative bluegrass

Dark, alpine green color

Mowing reduced 50%-80%

Excellent heat and drought tolerance

Very good wear and injury recovery

Vegetatively planted – regrowth from rhizomes

Rapid horizontal growth - fills in quickly

Minimal vertical growth - approx. four inches

Vegetative growth provides erosion control

Growing Regions

Testimonial

“For a Kentucky bluegrass, I am impressed with Bella. It is dark green, low-growing, and has excellent heat and drought resistance ”

– Dr. Robert Shearman, University of Nebraska
