Proud Sod Providers for:

Denver Broncos.....Invesco Field
Colorado Rockies.....Coors Field
CU Buffaloes.....Folsom Field
KC Royals.....Kauffman Stadium
St. Louis Cardinals.....Busch Stadium
Colorado Rapids.....Dick's Sporting
Goods Park

Reveille®

This is a hybrid turfgrass that crosses native Texas Bluegrass and Kentucky Bluegrass. This newer turf is a multi-use, cool-season grass that suits a number of climate conditions, including Colorado and the arid west. It also fulfills a number of needs such as lower maintenance and reduced water usage in various landscapes including golf courses, commercial sites, industrial parks, and home lawns. Reveille® offers a beautiful dark green color with medium texture, heat and full sun tolerance, winter hardiness, and insect and disease resistance. Reveille® is great for those who want a green landscape throughout the growing season without the labor-intensive seasonal changes from one turf to another. Reveille® turf does not tolerate frequent watering and prefers a "dry-down" period between irrigations in order to achieve a healthy root system.

Soil Recommendations

Reveille® has been successfully grown in a wide range of soil types and conditions. It is not recommended in extreme salt conditions or in areas that lack proper drainage. Complete and adequate soil preparation is highly recommended for this and all turf types. Visit our website for proper soil preparation instructions.

Shade Tolerance

Research has shown that Reveille® will perform similarly to turf-type Tall Fescue in shade. Please remember that each shade situation is unique and that all grass species were naturally selected from areas with full sun.

Fertilization

A pre-plant fertilizer is recommended for installation. A well-balanced fertilizer at a rate that adds about 1 pound of nitrogen per 1000 square feet applied to the surface of the soil works well. You may apply about 4 pounds of nitrogen per 1000 square feet per year for adequate fertility levels. A light application of iron is a better alternative during the summer to improve color. For questions, please visit our website or contact one of our knowledgeable staff members.

Mowing

During the spring and fall, Reveille® may be mowed as low as 1 1/2 inches. Adjust mowing frequency to remove no more than 1/3 of the grass blade length. During the summer months, raise the mowing height to at least 2 inches and as much as 3 inches. For best results, make certain the mower blade is sharp each time you mow to avoid damage to the blades of turf.
